

**Case Study 3***for February 11*

You are a consultant in the Statistical Consulting Center and a Psychology graduate student comes in to see you. One part of her dissertation involves people's motives for volunteering (typically some kind of community service work).

She has administered a questionnaire to about 300 volunteers. Based on this questionnaire she can compute six scores, one score for each of six motives for volunteering. The six motives are conceptually distinct, but the six scores are correlated.

At this point, she would like to have a single score to be used as an overall indicator of motivation for volunteering. Her question is how should she think about combining the scores into a single overall motivation score?

You need to do two things. First, determine one or more potential approaches for combining the scores into an overall motive score. Second, generate a list of questions that you would ask her to determine which, if any, of your potential approaches is appropriate.

## Group 1:

Name	Email
Feng Yi	yixxx064
Steve Nydick	nydic001
Pat Zimmerman	zimme450
Sen Yuan	yuan0066
Andy Johnson	joh03017
Stacy Orlett	moel0046

## Group 2:

Name	Email
Jeff Jones	jone1087
Brad Price	price412
Martin Bezener	beze0028
Christine Oehlert	oehl0010
Bo Ra Lee	leex4919
